Hotel Demand and Staffing Planner

Turn a room forecast into a staffing estimate a manager can check.

OPERATIONS AUTOMATION

Working portfolio demo

STAFFING PLAN

Fictional example

ROOMS TO SERVICE	BUFFERED WORKLOAD	PLANNING ESTIMATE
80	30.25	6
30 departures / 50 stayovers	labor hours	staff at 6 productive hours

Checkout workload

Stayover workload

900 min + 750 min = 1,650 min; add 10% buffer = 1,815 min

THE PROBLEM

A room forecast is not a staffing plan. Departures and stayovers take different amounts of work, and managers need to see the assumptions before changing a schedule.

HOW THE SAMPLE WORKS

The calculator separates checkout and stayover workload, adds an adjustable planning buffer, and rounds up to whole staff. Invalid or impossible room counts are rejected.

WHAT YOU CAN INSPECT

The fictional example has 30 departures at 30 minutes and 50 stayovers at 15 minutes. With a 10% buffer, that is 1,815 minutes or 30.25 labor hours; six staff cover it at six productive hours each.

A PRACTICAL FIRST PROJECT

A useful first project is mapping one existing room report into a repeatable staffing worksheet, with assumptions and exceptions visible.

A deterministic planning example, not a demand prediction model, labor optimizer, or live scheduling integration.
