# AES ReTrain Image Training Workflow Design

A scoped image-training extension design for an existing workbench.

**AI TOOLING DESIGN**

Proposed image workflow

## THE PROBLEM

Training tools can make a configuration look ready before its data, target architecture or execution path has been checked. A run button should not conceal those uncertainties.

## HOW THE SAMPLE WORKS

The proposed image lane separates dataset review, target-support checks, run configuration and held-out evaluation. Unverified compatibility blocks execution rather than becoming a silent assumption.

## WHAT YOU CAN INSPECT

The existing ReTrain workbench provides the product context. This sample adds an image-lane design and evaluation rubric, not a new model-training result. A target-support gate is intentionally unresolved until implemented and tested.

## A PRACTICAL FIRST PROJECT

Begin with dataset intake and evaluation requirements for the specified target. Confirm a compatible training path before offering execution or performance commitments.

Qwen Image 2.1 is the proposed target here. MOSS training support is not asserted. Broader model names, recipes, weights and private datasets are excluded.

AI-assisted design extension; the image-training lane remains proposed.

# Image Lane Readiness and Evaluation

A proposed Qwen Image 2.1 evaluation lane for the ReTrain workbench. This specification does not enable a training runner or establish target compatibility.

## READINESS BEFORE ANY RUN

| Gate | Evidence needed |
|---|---|
| Dataset rights | Ownership or permission for every source; exclude private customer material. |
| Dataset separation | Deduplication and a held-out evaluation set, separated before training. |
| Target compatibility | An implemented, documented runner for the exact target architecture. |
| Resource plan | Observed dry-run checks and an explicit compute/storage budget. |
| User confirmation | Approval for the bounded experiment after readiness checks pass. |

## EVALUATION RUBRIC WITHOUT INVENTED SCORES

| Criterion | Comparison | Acceptance rule |
|---|---|---|
| Prompt adherence | Baseline and candidate on held-out prompts | Agree the review standard before the run. |
| Visual consistency | Fixed settings and a balanced set of views | Record regressions and inconsistent examples. |
| Artifact rate | Blinded review of generated outputs | Count failures against a predefined rubric. |
| Reproducibility | Repeat the recorded configuration | Retain model version, settings and run evidence. |

Support status: Qwen Image 2.1 training remains proposed in this showcase. MOSS training support is not asserted. No accuracy, quality or speed score is supplied.
